

Power BI guide

How to set up relative paths for your data sources

What are absolute & relative paths

An **absolute path** is a complete path from the root directory to the target file or folder. Think of it as a full address, including the country, city, street, and house number. In Power BI, an absolute path might look something like this:

C:\Users\YourName\Documents\PowerBI\Report.pbix

Relative Paths

A **relative path** is a path that starts from the current directory and goes to the target file or folder. It's like giving directions from where you currently are, rather than from a fixed starting point. In Power BI, a relative path might look like this:

https \\Documents\PowerBI\Report.pbix.

Why do you need relative paths

- **Portability:** If you move the entire folder to another location or share it with someone else, the relative paths will still work as long as the folder structure remains the same.
- **Collaboration:** Team members can work on the project without needing to manually adjust paths for their specific directory structures.

2 methods

1. To connect a new data source
2. To change the connection of an existing data source

For this guide I am linking to a download of data from the [Charity Commission](#) website as the data there is in the public domain. From their site it is possible to download data files on all the charities in England and Wales.

Method 1: Connecting a new data source

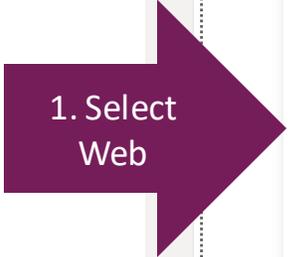

Open the file in Sharepoint or One Drive

The screenshot shows a SharePoint library named 'Cornerstone' with a file named 'publicextract.charity.txt' selected. A purple arrow points to the file with the text '1. Select the file'. Another purple arrow points to the file's metadata box with the text '1. Copy the path'. A third purple arrow points to the file's preview with the text '3. Scroll down to find the path'. A fourth purple arrow points to the 'i' symbol in the top right corner with the text '1. Click on the i symbol'. The metadata box shows the following information:

Type	TXT File
Modified	October 24, 2023
Path	Cornerstone > Documents > General > Charity commission data > publicextract.charity > publicextract.charity.txt
Size	147 MB

The preview shows a table with columns: date_of_extract, organisation_number, registered_charity_number, linked_charity_number, charity_name, c. The table contains 22 rows of data.

Method 2: Change the connection of an existing data source

This method can be done when you already have connections to data sources in your PowerBI report but want to change the paths from absolute to relative.
